1 Data

Mostly working with this data; but some others come in later to illustrate certain features.

```

2 asis

In this document, we are rendering tables inline as we knit. To accomplish this we need to pipe tables to `st_asis()` and you will see that in every example. If you are knitting a document and want to include a table, you should do this. If you are not knitting a document with included tables, you shouldn't use `st_asis()`

3 Simple table

- A data frame is wrapped in tabular environment
- The table is created with `threeparttable`

```
data %>% stable(cols_bold=TRUE) %>% st_asis()
```

4 Annotate

- Arguments to identify the name of the generating R script and the output file name
- The output file name is retained as an attribute to be used later when saving the table data
- Arbitrary notes are also allowed, provided as a character vector; item in the vector is placed on its own line

```
stable(  
  data,  
  r_file = "foo.R",  
  output_file = "foo.tex",  
  notes = c("Data were analyzed in quadruplicate.", "The results are very clear."),  
) %>% st_asis()
```

5 Notes in minipage

- By default, notes are put in the 3rd part of threeparttable
- Alternatively, we can put them in a minipage just below the table
- The width of the minipage needs to be set by the user

```
stable(
  data,
  note_config = noteconf(type = "minipage", width = 0.85),
  notes = c("Data were analyzed in quadruplicate.", "The results are very clear."),
) %>% st_asis()
```

6 Align

- Columns can be aligned center, left or right
- Columns can be aligned with a fixed width and aligned left, center or right
- Helper functions are provided as `cols_center()`, `cols_left()`, `cols_right()`
- The syntax is to state the default / base alignment for all columns and then pass exceptions to that default setting
- Center everything except for
 - STUDY (left)
 - DOSE and SCR (right)

```
data %>%  
  stable(align = cols_center(STUDY = 'l', .r = "DOSE,SCR")) %>%  
  st_asis()
```

7 Units

- Automatically put units under the column name
- Units are supplied as a named list, where names correspond with the column name prior to renaming
- The list can contain a subset of columns and can also contain names that are not in the table (there is no warning or error for the latter)

```
units <- ys_get_unit(spec, parens = TRUE)
```

```
stable(  
  data,  
  units = units,  
) %>% st_asis()
```

- Unlimited number
- Use ... to break; pass cols_break to alter the break sequence
- Units go on the bottom row when they are supplied
- Items are always pushed to the bottom

9 Extra column information

- Pass in a data frame any number of rows but same column layout (number and order) as the input data to add information to the header row
- I'm adding units in this example, but think of this as having general application

```
tmp <- slice(ptdata(), 1:5)

xtra0 <- slice(tmp,1) %>% mutate(across(everything(), ~""))
xtra0

10 Math

- Columns with at least two \$ are “math” and will not be sanitized
- Otherwise they are functions to “prime” the data frame
 - The default is to convert every column to character
 - Then walk the columns, look for non-math columns and sanitize them

```
ptab <- readRDS("datasets/ptab.RDS")
ptab

14 Add styling to data frame

- `tex_bold` will make table cells bold when they match pattern
- `tex_it` will make table cells italics when they match pattern
- styling is only added when there is at least one character
- input must be string
- combine this with `clear_rep` and `hline_from` to partition the table

```
tmp <- ptdata()
```

```
tmp <- mutate(tmp, STUDY = tex_bold(as.character(STUDY)))
```

```
stable(
  tmp,
  clear_reps = "STUDY",
  hline_from = "STUDY",
) %>% st_asis()
```

15 Panel

- Divide the table using column contents
- The panel column data is split in non-repeating chunks
- An error is generated if there are multiple panels with the same name; this can be overridden
- A prefix can be supplied that gets pasted on the front of the column title; the prefix can also come from the name of the supplied panel panel ID (e.g. `c(prefix_text = panel_name)`)

```
stable(  
  data,  
  panel = as.panel("STUDY", prefix = "Study number: "),  
) %>% st_asis()

17 Colspan

17.1 Basic

- Group columns with a spanning line and a title
- The span goes above the highest row in the column header box

```
stable(  
  data,  
  span = colgroup("In final model", WT:CRCL),  
) %>% st_asis()
```

17.3 Split from columns

- We have some columns of the form tag.name
- These are split on the sep argument; the tag (common across columns in the group) forms the spanner title
- The column names are formed by splitting tag. off of tag.name

```
dotdata <- readRDS("datasets/with-dots.RDS")
head(dotdata, n=2)
```

17.4 With titles breaking across lines

You can include ... in the title it will break in to multiple lines. You can alter the split sequence with the `span_title_break` argument (default is ...). See `?tab_spanners`.

This feature is in addition to the functionality allowing you to break column names (control the split sequence with `cols_break`, where default is also ...).

```
out <- stable(  
  stdata(),  
  span = colgroup("Final model ... Covariates", WT:SCR),  
  cols_rename = c("Study Protocol ... Number" = "STUDY")  
) %>% st_asis()
```

18 Handle wide columns

- This shows using `col_ragged()` alignment to fix the width of a column that has a lot of text in it

18.1 `descr` is taking over the table

```
ptable <- readRDS("datasets/ptable.RDS")  
  
stable(ptable) %>% st_asis()
```

symbol	descr	estimate	standard.error
CL (L)	Metabolic clearance in adults who graduated high school before 1973 and live in Muncie.	100	200

18.2 Limit `descr` to 5 cm

```
stable(  
  ptable,  
  align = cols_center(descr = col_ragged(5))  
) %>% st_asis()
```

symbol	descr	estimate	standard.error	rse
CL (L)	Metabolic clearance in adults who graduated high school before 1973 and live in Muncie.	100	200	2

19 Identify a summary row

- We can point to one or more rows and style it up as a “summary row”
- The summary row can be styled
 - with a horizontal line above
 - with bold text in a designated column
 - with alternate text in a designated column
- Multiple summary rows can be specified in a list

```
df.total <- readRDS(file = "datasets/with-total.RDS")
df.total
```

```

20 Save the table to file

- There is a output file attribute on the text that is returned
- When the stable output is passed to `stable_save()`, the attribute is used as the output file name

```
tab <- stable(data, output_file = "foo.tex")
str(tab)
```

```
## 'stable' chr [1:26] "\\setlength{\\tabcolsep}{5pt} " ...
## - attr(*, "stable_file")= chr "foo.tex"
```

This can be used to save

```
stable_save(tab)

file.exists("foo.tex")
```

```
## [1] TRUE
```

21 Long table

- Long table is based on a call to `stable`
- The table header, tabular environment and table notes are reused

```
long <- ptdata()
long <- map_dfr(1:2, ~ long) %>% arrange(STUDY,DOSE,FORM)

long %>%
  stable_long(
    panel = "STUDY", cols_bold = TRUE,
    units = ys_get_unit(spec, parens = TRUE),
    notes = "The results look great!",
    clear_reps = "DOSE",
    cols_rename = c(Formulation = "FORM"),
    r_file = "foo.R", output_file = "../deliv/table/output.tex",
    note_config = noteconf(type = "minipage", width = 0.8, table_skip = 0.2)
  ) %>% st_asis()

- The font size can get bumped up or down in special circumstances
